

At least something
is working hard
around the house today.

American Standard
HEATING & AIR CONDITIONING
AmericanStandardAir.com

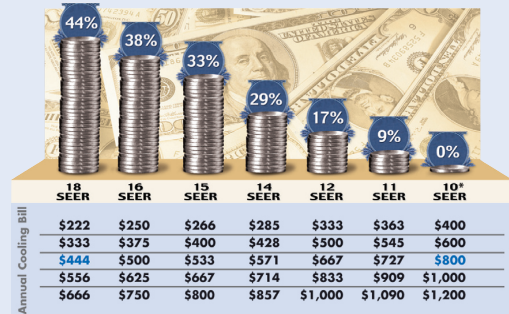

American Standard air conditioning systems are engineered to work hard around the clock, year in and year out, to keep your house just the way you like it—cool, comfortable and worry free. And since our systems carry the Energy Star® logo,* we guarantee you'll keep your cool when you open your energy bill each month. (Now, considering all this, it wouldn't surprise us one bit if you feel the sudden urge to reevaluate who man's best friend really is.)

*American Standard's home comfort systems with a Seasonal Energy Efficiency Ratio (SEER) of 12 or higher qualify for the Energy Star® label.

If your current air conditioner is more than ten years old, it could be operating at lower than 10.00 SEER. Compare the estimated annual cooling bill of a 10.00 SEER system to that of a new system with a higher SEER such as American Standard's 18, 16, 14, 12 or 11. For instance, if the annual cooling bill of a 10.00 SEER system was \$800, it could potentially cost \$444 for an 18.00 SEER system, or an annual savings of 44%. These numbers should remain consistent over time as long as preventive system maintenance is performed on a regular basis.

Potential energy savings may vary depending on your personal lifestyle, system settings, equipment maintenance, local climate, actual construction and installation of equipment and duct system.
